

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

1X. A Letter from Mr. Halley of June the 7th. 97. concerning the Torricellian Experiment tryed on the top of Snowdon-bill and the success of it.

AST Whitson-week by the favour of Mr. Davis, a good Friend of Dr. Trancred Robinson's, I had the opportunity of seeing what I pleased in North Wales, and was on Wednesday May 26, on the top of Snowdon, where I tried the Torricellian Experiment with all the satisfaction I could wish for; the Air continued both before and after in the same state as I got it verified by Mr. Davis's standing Barometer at Llannerch in Denby-shire, about 25 Miles East from Snowdon where it was Observed as follows.

		ħ	•	Inch.	•

LLanerch is about a Mile and an half above the Town of St. Afaph, about 6 Mile from the Mouth of the River

River Lluyd, which falls with a rapid Stream into the Irish Sea; and consequently, is several Foot above the Surface thereof.

May 26. Between One and Two in the Afternoon, on the top of Snowdon, I thrice repeated the Experiment, and as often found the height of the Mercury 26 Inches 1. And being come down to Llanberris, at the Foot of the Hill, about Six that Evening, I as often found it 29 Inches 4. A little above this place, are the principal Fountains of the River, that falls into the Channel of Anglesey, at Carnarvon, call'd anciently Segontium, whither we went the next Day; and about Eight at Even, found the Mercury, by a triple Experiment, to stand at 29 Inches 9°, very near the Surface of the Sea: When. at the same time, at Llanerch, it was not above 29 72; whence I conclude, that the Difference of the Airs Presfure on the Sea, and on the top of Snowdon, is rather more than 3 Inches, 8 Tenths. I could have wish'd for one of Mr. Hunt's portable Barometers; which will certainly be accurate enough for taking the Levels, for bringing of Water from distant places, and certainly much less subject to Error; there being a Tenth of an Inch for each Thirty Yards, which may be divided into many parts evidently. Snowdon was measured by Mr. Cafwel, with Adams's Instruments, to be 1240 Yards high; which abating the height of the Mercury 3 Inches, 8 Tenths, may serve for a Standard, 'till a better be obtained on a higher place. From hence the Sea dipt every-where above a Degree below us, the Visible Horizon being a lesser Circle, and we saw Ireland plainly, from the WbS to SWbW, and then appearing in the NNW, and the Mountains of Cumberland or Westmoreland very faictly, but evidently in the North; and I think we saw as far as St. David's Head into the South: Carnar vonshire and Anglesey lay under us, like a Map, affording a very pleasant Prospect, were it not for the Horrours of the Neighbouring Precipices. Hence we counted fifteen or fixteen Lakes, great and small, where the Cavities of the Rocks are filled up with the Rills that gleet from the Hills; all these are said to abound with Trouts, some of which we found to be sipecial good Fish: And in one of these Lakes I was on board a floating Island, as it may be called; the Lake is scarce half a Mile about, environed with a boggy turfy Soil, a piece of which, about fix Yards long and four broad, floats on the Water, being about five or fix Inches raised above it, but it, I believe, about eighteen Inches deep within the Water, having broad spreading sungous Roots on its fides, the lightness of which Buoys it up. It was driven on the Lee shore, but I lanched it off and Swam it, to be satisfied it floated: This I take the more notice of, because it is denied to be true, by the Author of the Additions to Cambden, lately Published: But I my felf faw it as described, and was told it had formerly been bigger, there being a lesser spot, that they told us had been heretofore a part thereof, which floated likewise. I have not time nor Paper to describe this horrid spot of Hills, the like of which I never yet saw, but shall endeavour therewith to give the Society a further Entertainment.

Tours, &c.
